MUSICAL PLAYLIST MANAGER

Problem Statement

Create a menu-driven C++ program to manage a musical playlist using a Doubly Linked List. Each song should store its title, artist, and album. The program should allow users to add, display, search, delete, and reverse songs in the playlist, as well as navigate to the next and previous song. It should also provide an option to clear the playlist and exit safely.

Objectives

1. Understand how nodes and pointers work in a Doubly Linked List.
2. Implement forward and backward traversal.
3. Insert and delete song nodes while maintaining correct links.
4. Search for songs by title.
5. Reverse the playlist and manage dynamically allocated memory.

Expected Outcome

A working console application that lets a user maintain and navigate a playlist through a simple menu.
